Product Name: Callout Demon

Release Name: First Release

Revision: 4

Release Date: 4/9/2024

High Level Goals:

- Let the user choose what map they want to practice

- Option to choose between guessing location given callout and callout given a location

- Speech-to-text to allow for guessing of callouts

- Valorant API to display the map the user is currently playing

Sprint 1:

{1} - As a user practicing callouts, I want to be able to choose what map I'm currently training for using a list and button to confirm a switch between maps. The map is displayed as a circle in the middle of the application. So I can practice callouts. [8]

{2} - As a user playing valorant, I want the map to be automatically chosen based on the map currently being played using the valorant API, so that I can reference callouts during a match. [5]

Sprint 2:

{3} - As a user practicing callouts, I want a callout name to be displayed under the map, so that I can guess the callout location on a map by clicking that location. [8]

{4} - As a user playing valorant, I want a hotkey so I can bring the application in and out of focus, so that I can quickly get the overlay off my screen when It is in the way. [5]

{5} - As a user practicing callouts, I want to be able to add new callouts and edit existing callouts, so that I can practice custom callout names and locations I use with a team. [8]

Sprint 3:

{6} - As a user practicing callouts, I want the option to be able to guess callouts using voice commands instead of clicking the map, so it is more like when playing the game. [13]

{7} - As a user practicing callouts, I want another option to see an image/video of a player location under the map, so that I can guess the callout location. [5]

{8} - As a user, I want to be able to practice callouts on a website instead of my computer. [5]

Sprint 4:

{9} - As a user, I want to be able to sign in to the website. [5]

{10} - As a user, I want to be able to save my callouts on the website. [8]

{11} - As a user, I want to be able to see the area a callout covers while I'm adding it, so I can be more precise with my placement. [5]

Product Backlog:

{12} - As a user, I would like to be able to see my in-game stats for a specific map or weapon, so that I can know if I'm getting better. [5]

{13} - As a user, I want to be able to see specifically what areas a callout covers, so that I can tell callouts apart easier. [5]

{2} - As a user playing valorant, I want the map to be automatically chosen based on the map currently being played using the valorant API, so that I can reference callouts during a match.

{4} - As a user playing valorant, I want a hotkey so I can bring the application in and out of focus, so that I can quickly get the overlay off my screen when It is in the way.
